```python
import socket

def Main(host, port):
    # Create the socket object
    objSocket = socket.socket()

    # Connecting to the server
    objSocket.connect((host, port))

    # Send the Request
    req = input("Enter Any Request -> ")
    while (req):
        # Send the request
        objSocket.send(req.encode('utf-8'))

        # Receiving the response
        resp = objSocket.recv(1024).decode('utf-8')
        print ("Server Says -> ", resp)

        # Sending one more request
        req = input("Enter Any Request -> ")

    # Closing the connection
    objSocket.close()

if (__name__ == '__main__'):
    Main('127.0.0.1', 5001)
```
